

Executive Summary: Project Status Report on scottyab/rootbeer project

The scottyab/rootbeer project continues to be a pivotal course in our “company”. Even though this was made back in 2015, the latest update in 2021, it still serves as a learning experience for students.

While making repo_mining, I utilized code from msrLab cloned from a professor’s repo. I modified it so that it writes out the information we need, which are the files in the project and their authors, plus the date they were latest updated. I achieved this by using GitHub API; the project contributors should monitor every access.

From what I have seen, Scott Alexander-Bown appeared on my feed the most, I believe he is definitely the most valuable member of the project team.

Some git commands I found useful:

Git blame -> tracks who touched the commit so you know who to ask when a problem occurs.
